| Analyte description | Influenza A is a genus of the Orthomyxoviridae family of viruses and includes only one species which causes influenza in birds and some mammals. There are several subtypes, labeled according to an H number (for the type of hemagglutinin) and an N number (for the type of neuraminidase). There are 16 different H antigens (H1 to H16) and nine different N antigens (N1 to N9). Each virus subtype has mutated into a variety of strains with differing pathogenic profiles; some pathogenic to one species but not others, some pathogenic to multiple species. |

Pair recommendations

| | | DETECTION | | |
|---------|------|-----------|------|------|
| | | 7304 | 7305 | 7307 |
| CAPTURE | 7304 | - | + | - |
| | 7305 | + | - | + |
| | 7307 | - | + | - |

The pair recommendations are based on antibodies binding to different epitopes. As nucleoprotein is abundant in the virus, all antibodies pair with themselves and each other.

Please note that pair recommendations are based on results obtained by our laboratory. Equally good results may be obtained using other pairs and therefore these recommendations are only indicative.

Product stability

| TEMPERATURE, TIME | RESULT |
|-------------------|--------|
| -70 °C, 21 days | N/D |
| -20 °C, 21 days | OK |
| +4 °C, 21 days | OK |
| +30 °C, 21 days | OK |
| +35 °C, 21 days | OK |
| +45 °C, 7 days | OK |

Stability testing is performed in the product buffer to see whether different temperatures affect the antigen binding, charge or composition of the antibody. Please note that the shelf life given on the first page is based on real time stability testing at 2–8 °C in the product buffer.
